## Functional MRI decoding

### Relate brain activation to cognitive stimuli

- Many small studies with  $\neq$  psychological paradigms
- A few large scale studies (1000s subjects)

How to aggregate heterogeneous fMRI data into a common cognitive model ?

## Learning setting

- First level GLM  $\rightarrow$  **z-score maps**
- One map / record / base-condition
- Condition prediction on **new subjects**
- Baseline: **Multinomial regression**

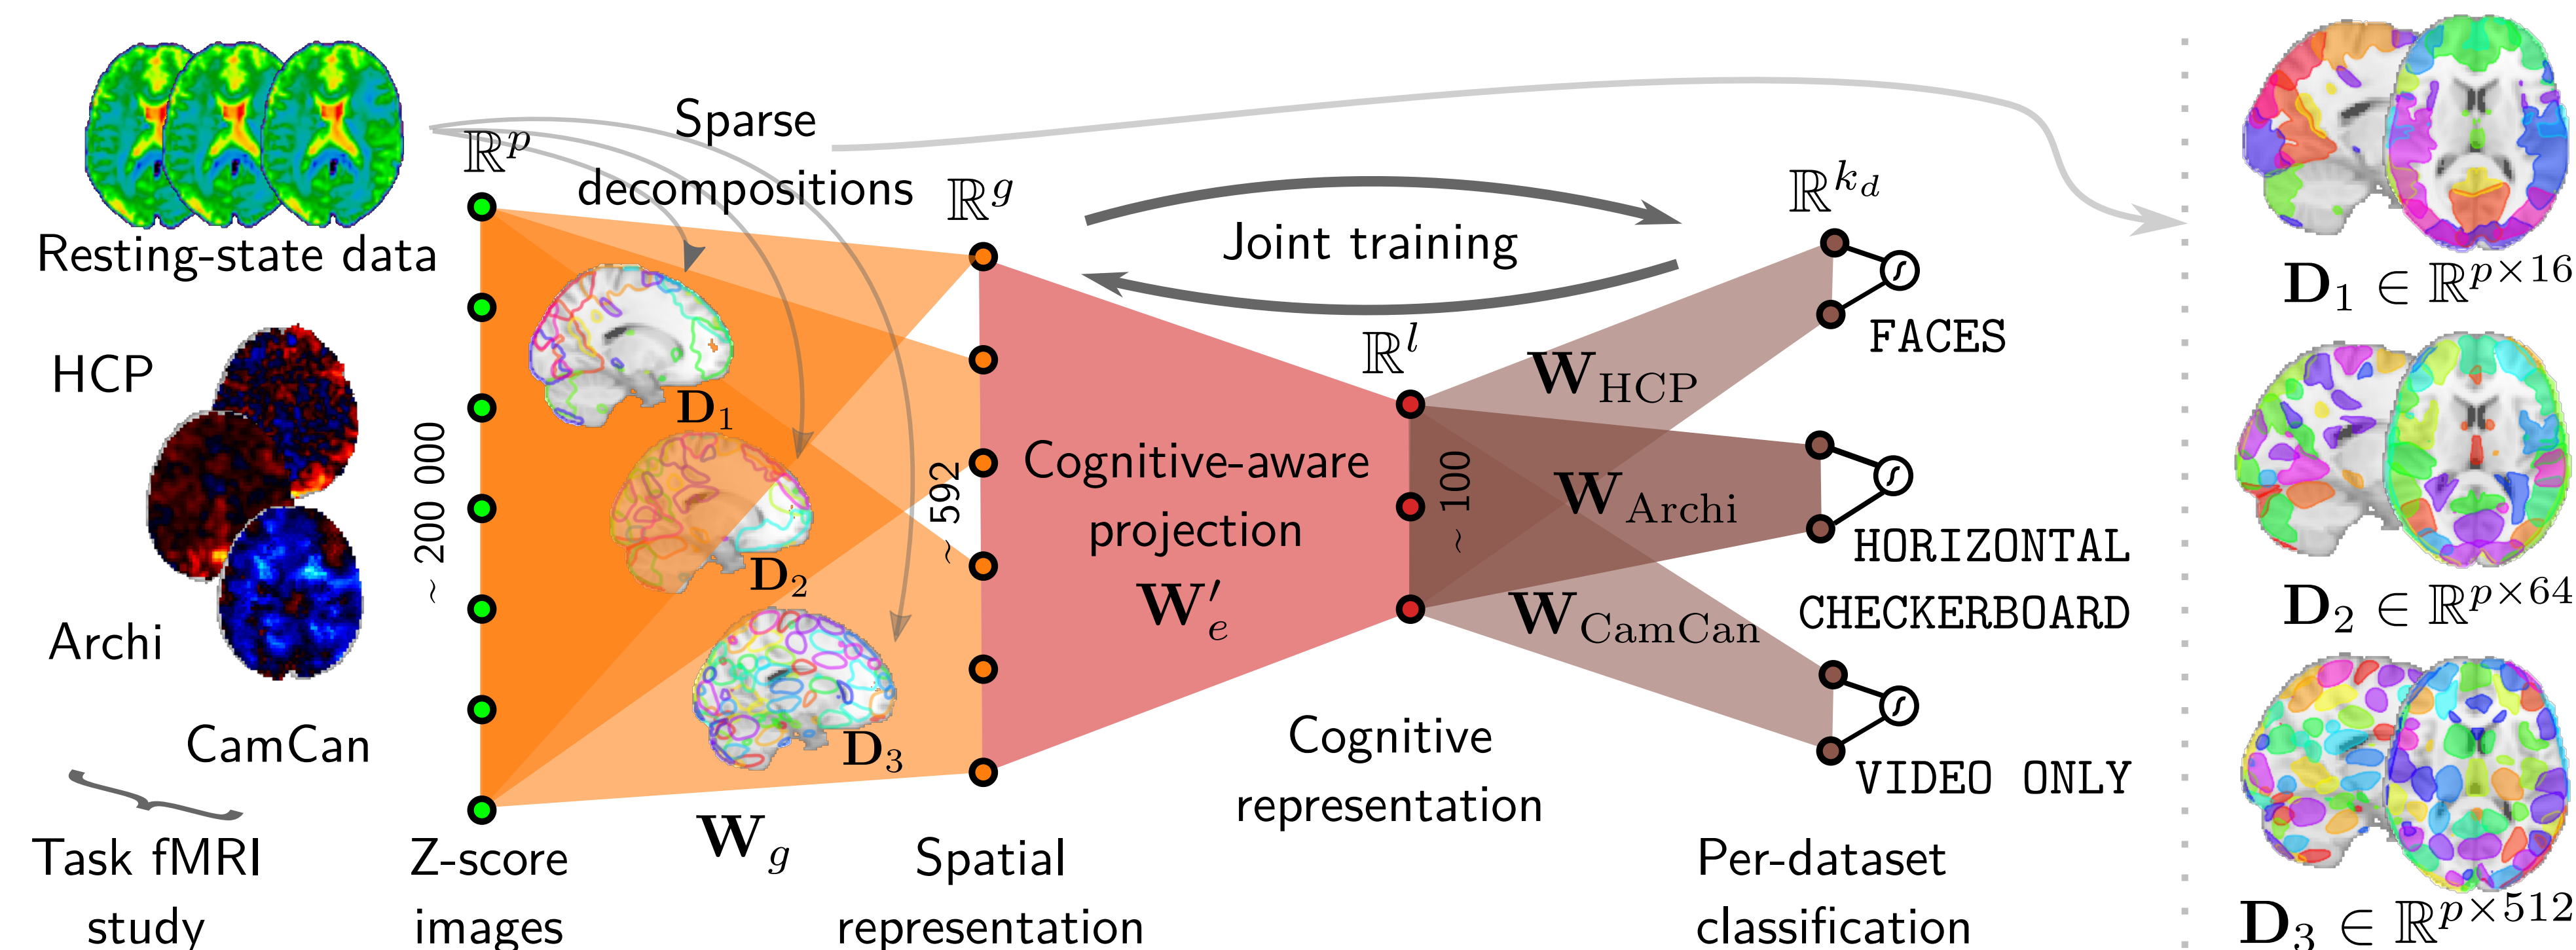

## Performance

- Dimension reduction** using resting state data is efficient regularization (and  $\downarrow$  train cost)
- Extra efficient **latent layer + Dropout** (explains green to red improvement)
- Transfer learning** occurs, and is stronger with more datasets (red  $\rightarrow$  purple  $\rightarrow$  brown)

## Model

### Dimension reduction $W_g$

- Sparse dictionaries** from HCP resting-state [2]  
 $\mathbf{X}_{rs} = \mathbf{D}\mathbf{A} \in \mathbb{R}^{p \times g} \times g \times n$ ,  $\mathbf{D}$  sparse
- Orthogonal projection  $\rightarrow$  one time-serie / component
- Unsupervised setting  $\rightarrow$ : number of components ?
- $\rightarrow$  **Multi-scale** dictionaries

### Latent space embedding

- Finding a common representation of brain images
- Easy to classify for **multiple datasets**
- Factorized linear model (with 2 layers,  $l < g$ )  
 $\forall d \in D, \mathbf{W}_d = \mathbf{W}_e \mathbf{W}'_d \in \mathbb{R}^{g \times l} \times \mathbb{R}^{l \times k_d}$
- Share parameter for tranfer learning**

## Regularization

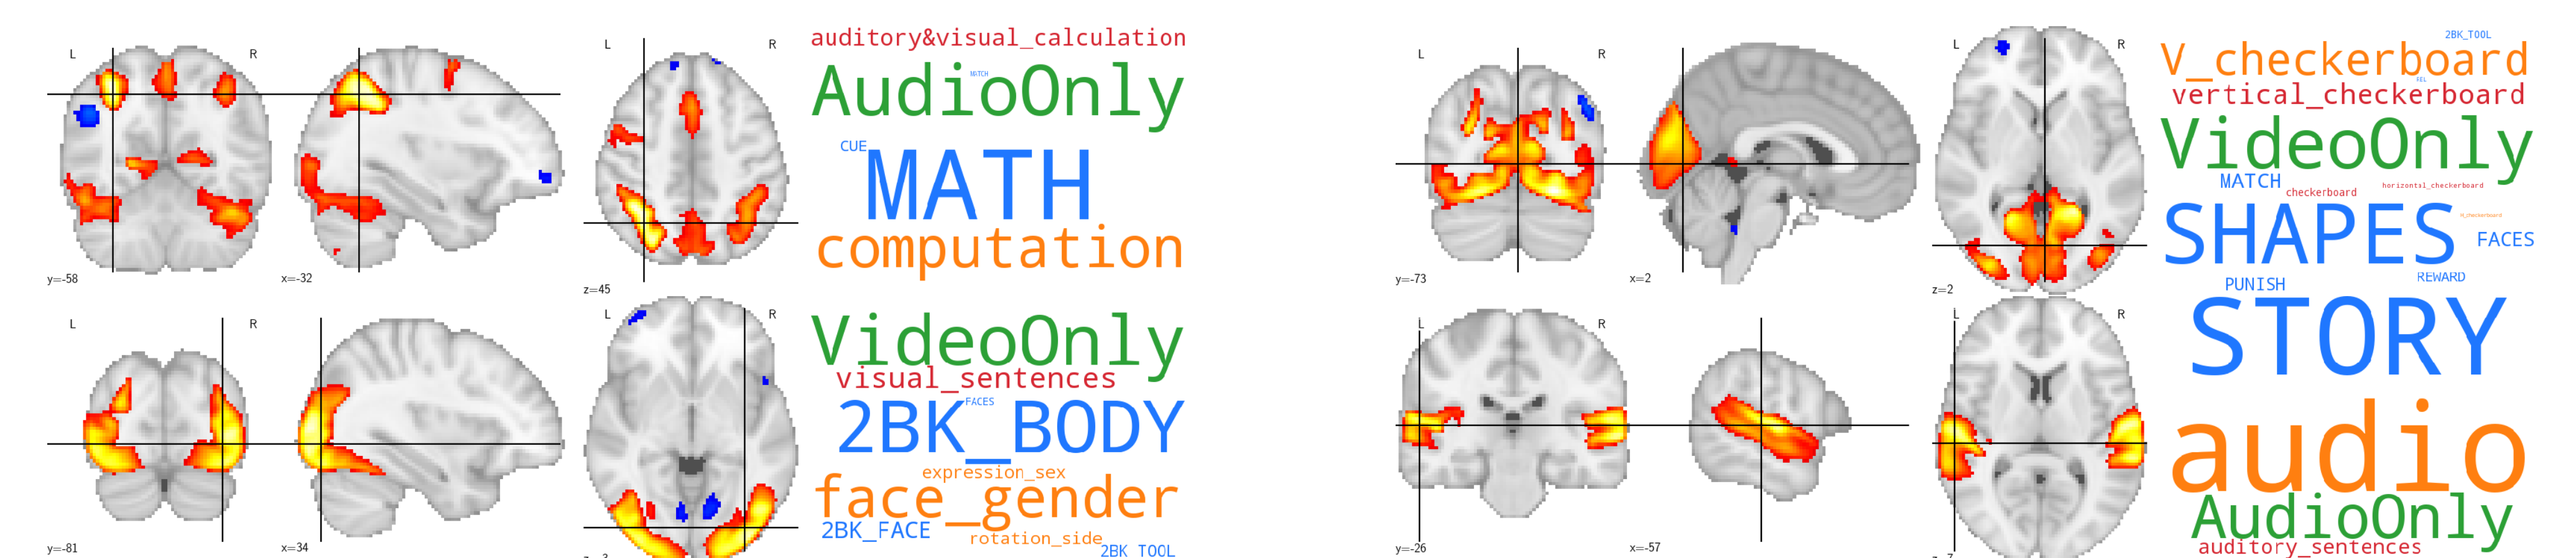

- We allow  $l > k$ : not a reduced rank regression
- Trivial with  $\ell_2$  regularization: no transfer
- Dropout** allows transfer despite  $\mathbf{W}_d$  full rank:  
(training)  $\mathbf{y} = \mathbf{x}\mathbf{W}_e\mathbf{M}\mathbf{W}'_d$ ,  $\mathbf{M}$  masking matrix

## Transfer improves learning curves

Transfer learning becomes more useful as train-set size reduces

## Cognitive space visualization

Meaningful template images associated to multi-dataset predictions (one color per dataset)

## Interpretability

Model  $\rightarrow$  Higher-level regions (e.g. FFA)

## Conclusion and future work

- Scalable and paradigm-agnostic model**
- With evidence of **transfer learning**
- Dictionaries + python code available  
[github.com/arthurmensch/cogspaces](https://github.com/arthurmensch/cogspaces)
- Model to be tested on the whole **openFMRI** repository
