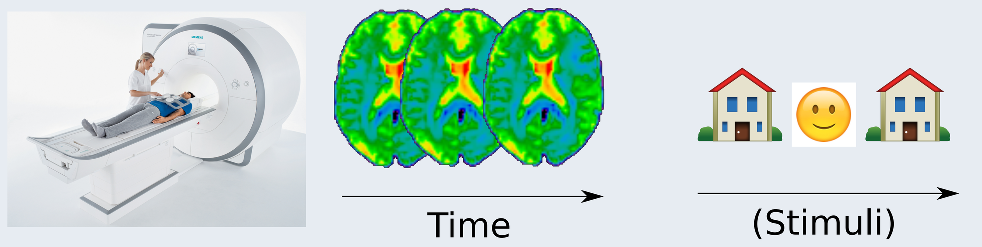
Functional MRI decoding



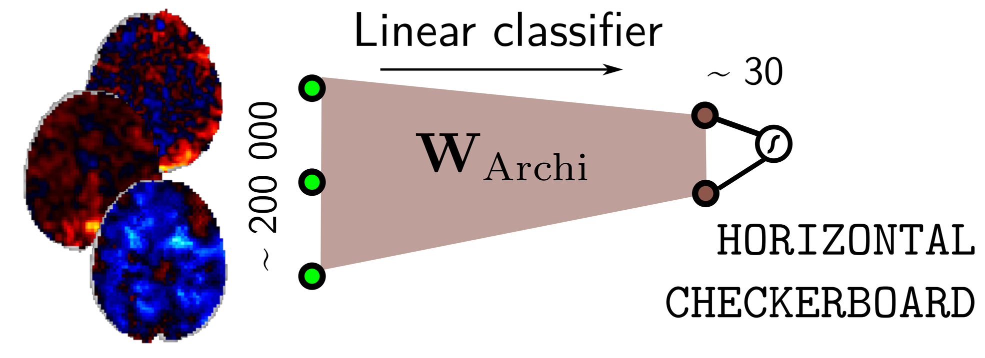
Relate brain activation to cognitive stimuli

- Many small studies with ≠ psychological paradigms
- A few large scale studies (1000s subjects)

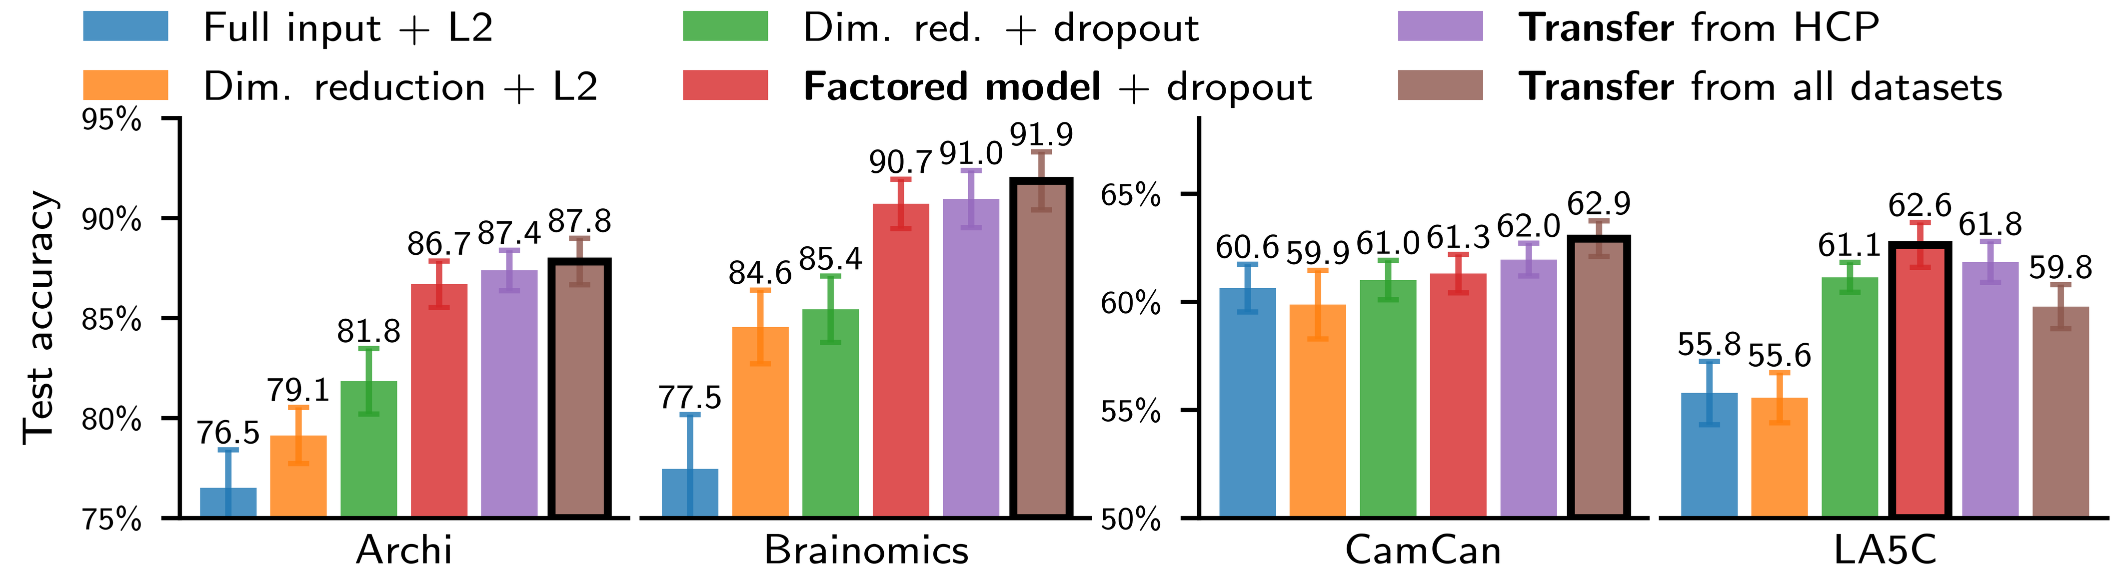
How to aggregate heterogeneous fMRI data into a common cognitive model ?

Learning setting

- First level GLM → **z-score maps**
- One map / record / base-condition
- Condition prediction on **new subjects**
- Baseline: **Multinomial regression**

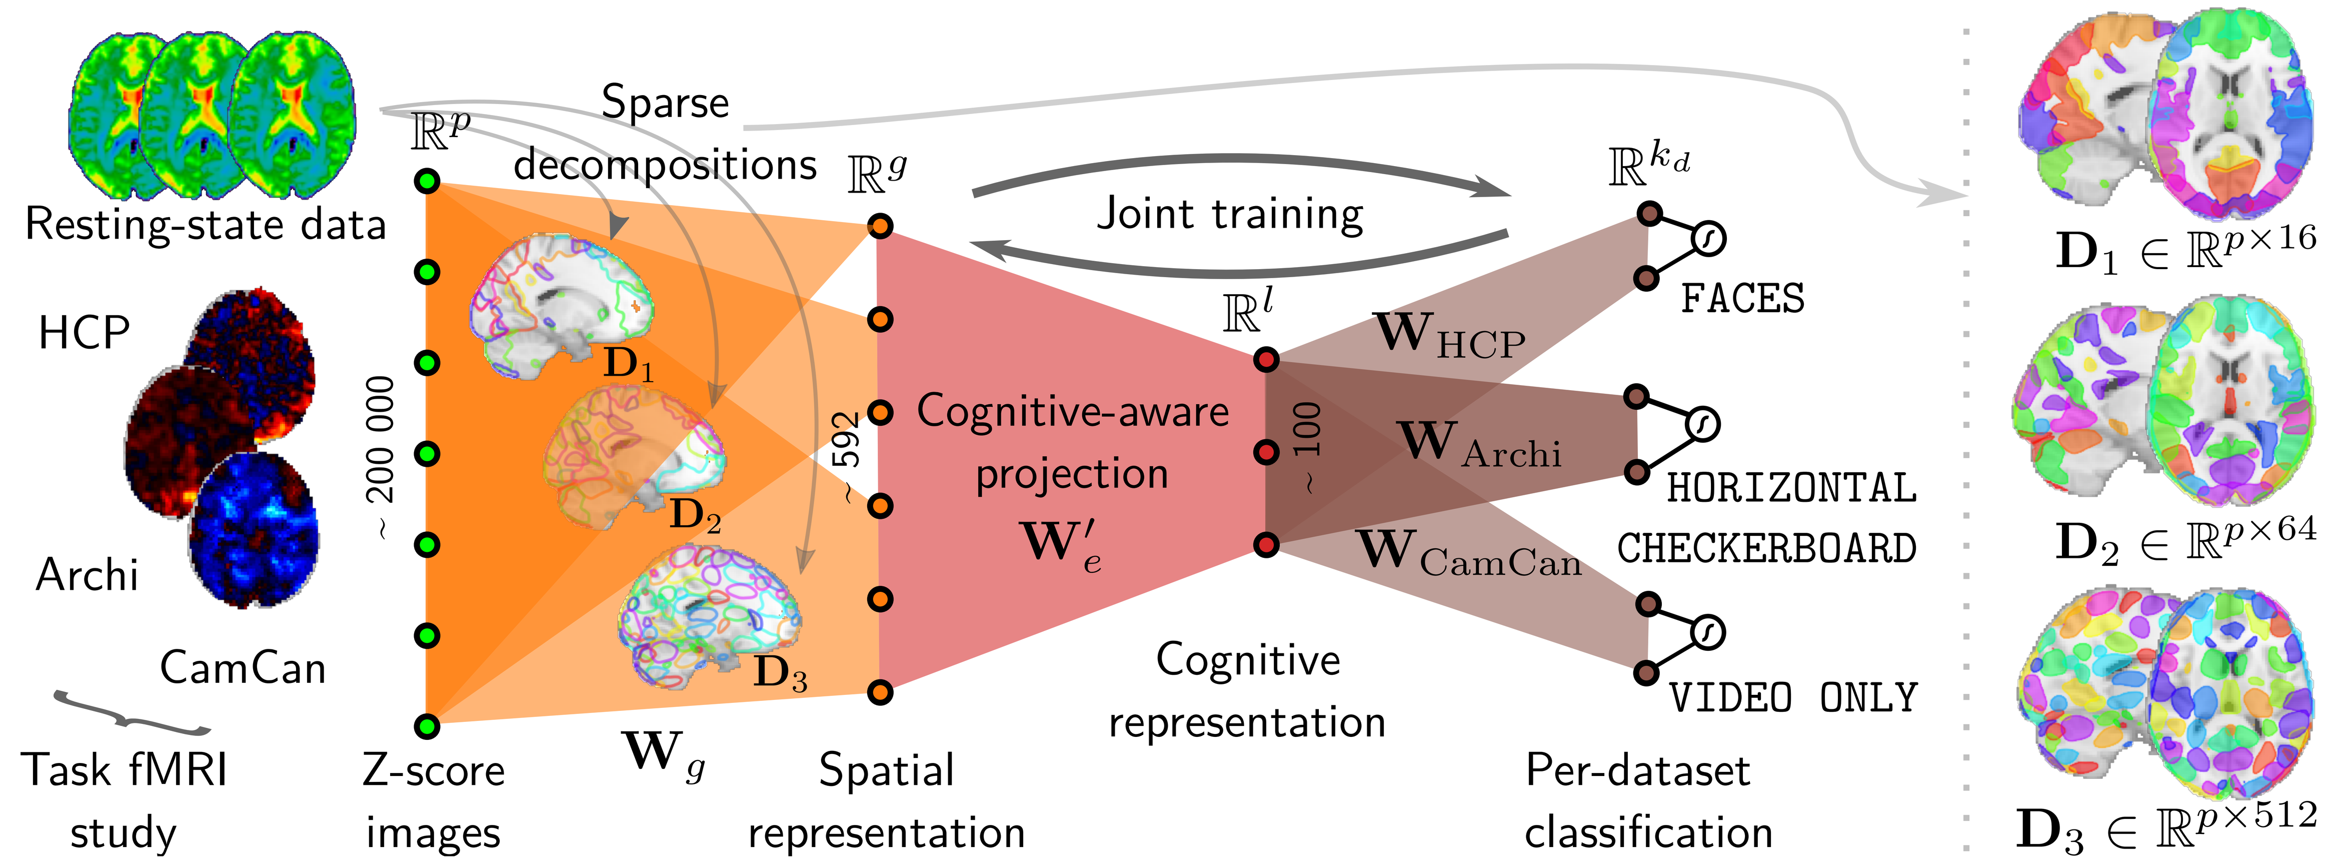


Performance



- **Dimension reduction** using resting state data is efficient regularization (and ↓ train cost)
- Extra efficient **latent layer + Dropout** (explains green to red improvement)
- **Transfer learning** occurs, and is stronger with more datasets (red → purple → brown)

Model



Dimension reduction $\mathbf{W}_g$

- **Sparse dictionaries** from HCP resting-state [2]

$$\mathbf{X}_{rs} = \mathbf{D}\mathbf{A} \in \mathbb{R}^{p\times g} \times g \times n, \qquad \mathbf{D} \text{ sparse}$$

- Orthogonal projection → 1 time-serie / component
- Unsupervised setting → number of components ?
- → **Multi-scale** dictionaries

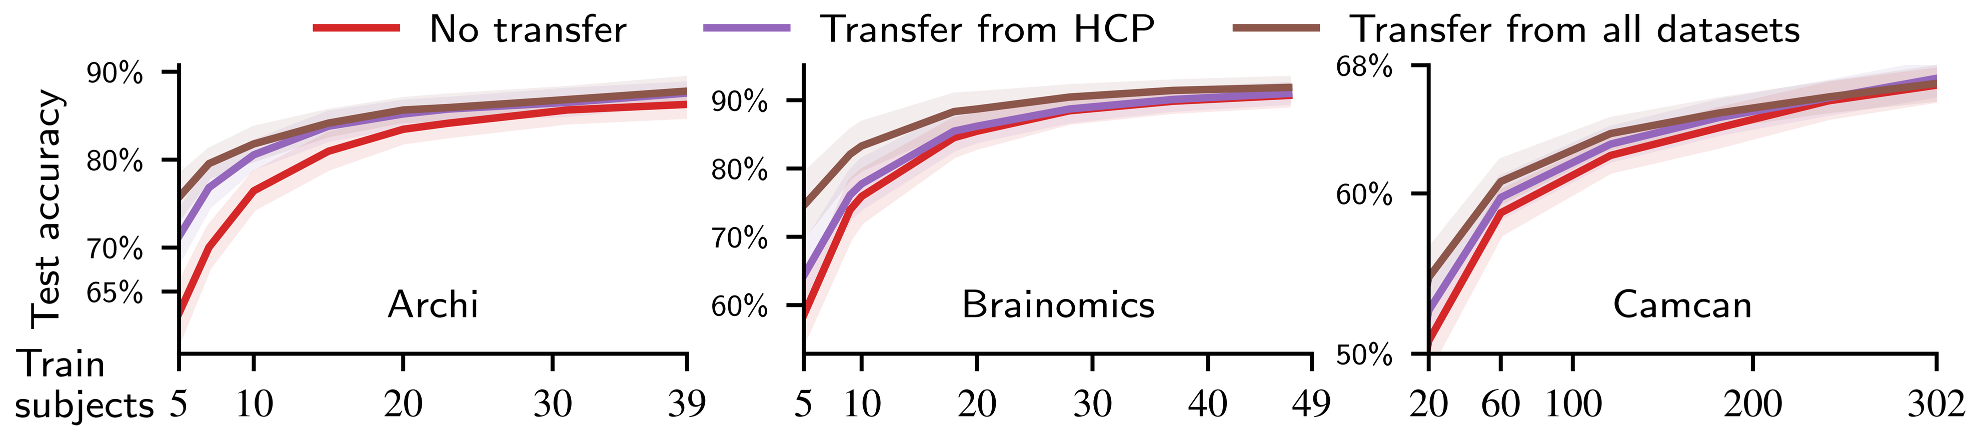
Latent space embedding

- Finding a common representation of brain images
- That is easy to classify for **multiple datasets**
- Factorized linear model (with 2 layers, $l < g$)

$$\forall d \in D,\ \mathbf{W}_d = \mathbf{W}_e \mathbf{W}'_d \in \mathbb{R}^{g\times l} \times \mathbb{R}^{l\times k_d}$$

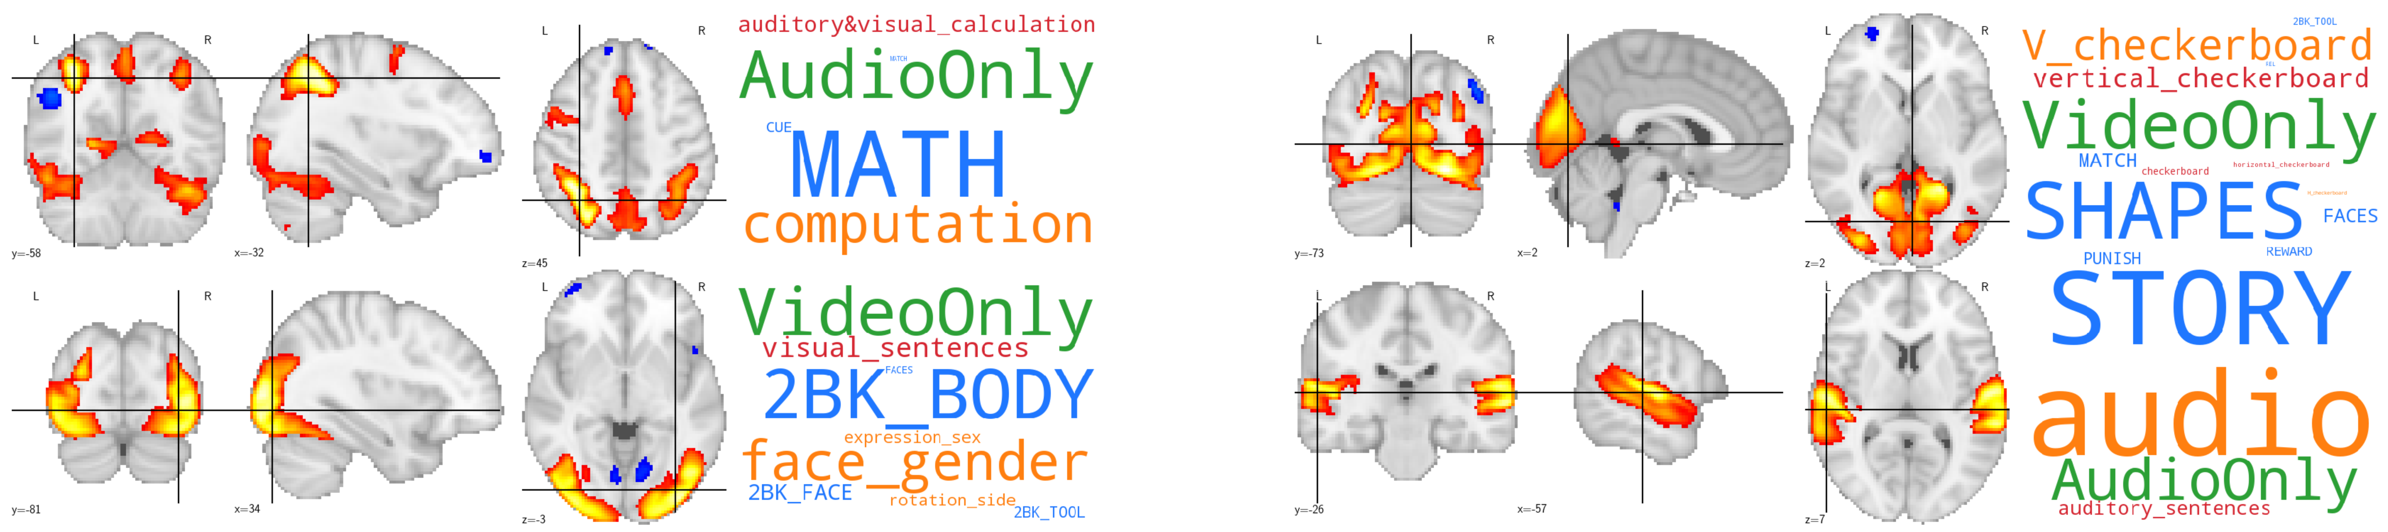
- $\mathbf{W}_e$ **is shared**: multi-task/**transfer learning**

Transfer improves learning curves



Transfer learning becomes more useful as train-set size reduces

Cognitive space visualization



Meaningful template images associated to multi-dataset predictions (one color per dataset)

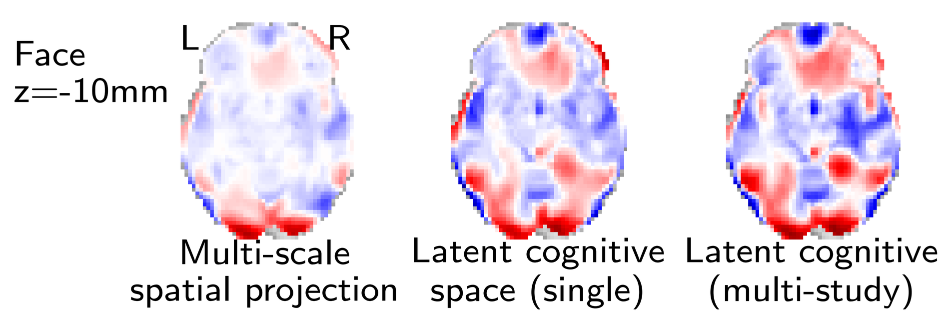
Regularization

- We allow $l > k$: not a reduced rank regression
- Trivial with ℓ_2 regularization: no transfer
- **Dropout** allows transfer despite $\mathbf{W}_d$ full rank:

(training) $\hat{\mathbf{y}} = \mathbf{x}\mathbf{W}_e\mathbf{M}\mathbf{W}'_d$, $\qquad$ **M** masking matrix

Interpretability



Model → Higher-level regions (*e.g.* FFA)

Conclusion and future work

- **Scalable** and **paradigm-agnostic** model
- With evidence of **transfer learning**
- Dictionaries + python code available

`github.com/arthurmensch/cogspaces`

- Model to be tested on the whole **openFMRI** repository
